

Project Overview

- Valentino Project: Browser-Based Calendar & Task App
- Designed for managing school and personal tasks
- Accessible on browsers and mobile phones
- Free for all users, especially Valentino
- Supports collaborative task management

Core Features

- Add, delete, and modify tasks
- Assign due dates and mark completion
- Set task dependencies
- Categorize tasks (up to 50)
- Invite friends to help with tasks
- Control permissions and visibility
- Receive automated reminders (including SMS)
- Attach images to tasks

Views & Organization

- Calendar view: day, week, month options
- Task view with status, due dates, and categories
- Recap of tasks due and completed
- Past due tasks highlighted
- Task history stored for 1 year
- Limits: up to 100 open tasks and 100 friends

Technical Architecture

- Cloud-based infrastructure
- Database, web server, and app server hosted in cloud
- Supports browser and mobile phone access
- Customizable themes
- Clean and intuitive UI

Database Design

- Tasks table: details, status, dependencies
- Calendar table: scheduling data
- Friends table: collaborator data
- Categories table: task grouping
- Security table: permissions and visibility settings
- Data retention: 1 year of history

How It Works

- Users sign up and create tasks
- Tasks can be assigned to self or friends
- Due dates trigger reminders (including SMS)
- Tasks appear in both calendar and task views
- Completed tasks archived for review
- Security settings ensure privacy

Example Use Cases

- Students: track homework, deadlines, group work
- Families: organize chores and shared tasks
- Small teams: manage meetings and follow-ups

User Interface Option 1 - Kanban

Organizing Tasks Visually

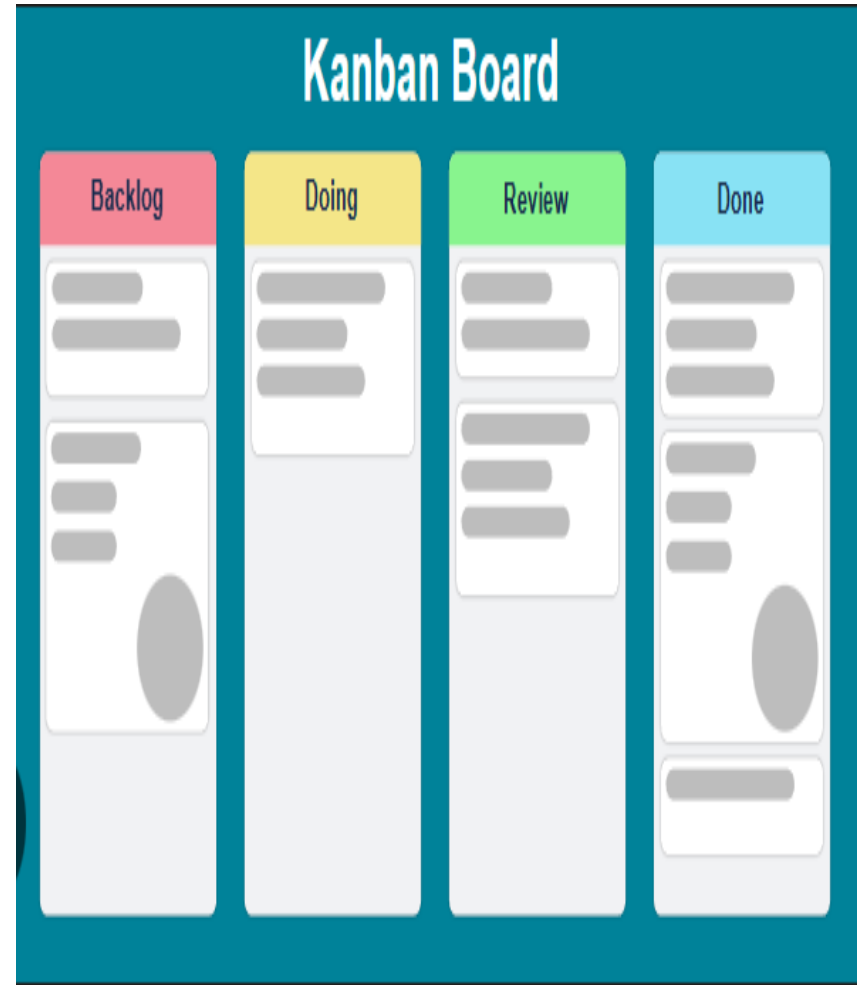

A Kanban board displays tasks in columns such as To Do, In Progress, and Done, making workflow easy to understand.

Moving Task Cards

Users move cards across columns to show task progress, offering clear, interactive task management.

Tracking Daily Goals

A simple Kanban board helps users track daily goals like finishing a report, reading emails, or calling a client.

User Interface Option 2 - Calendar

Visual Task Management

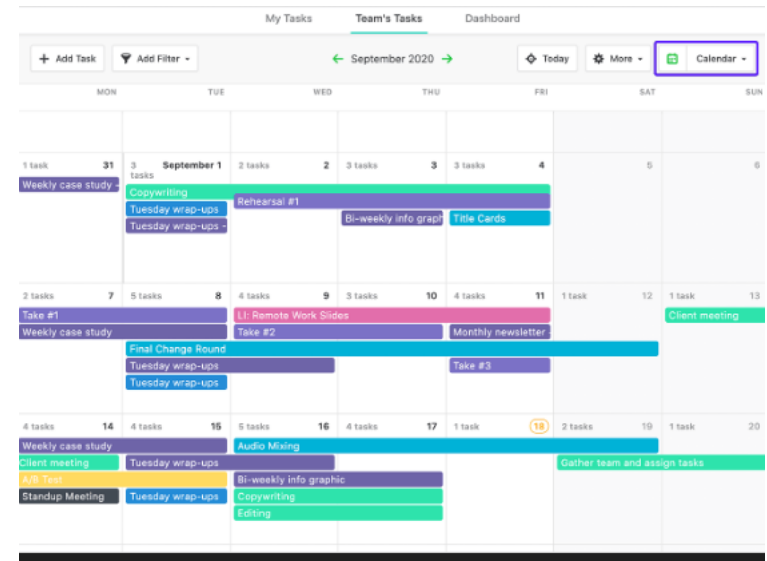

Calendar View helps users see tasks and events visually, making it easier to organize schedules and priorities.

Easy Deadline Tracking

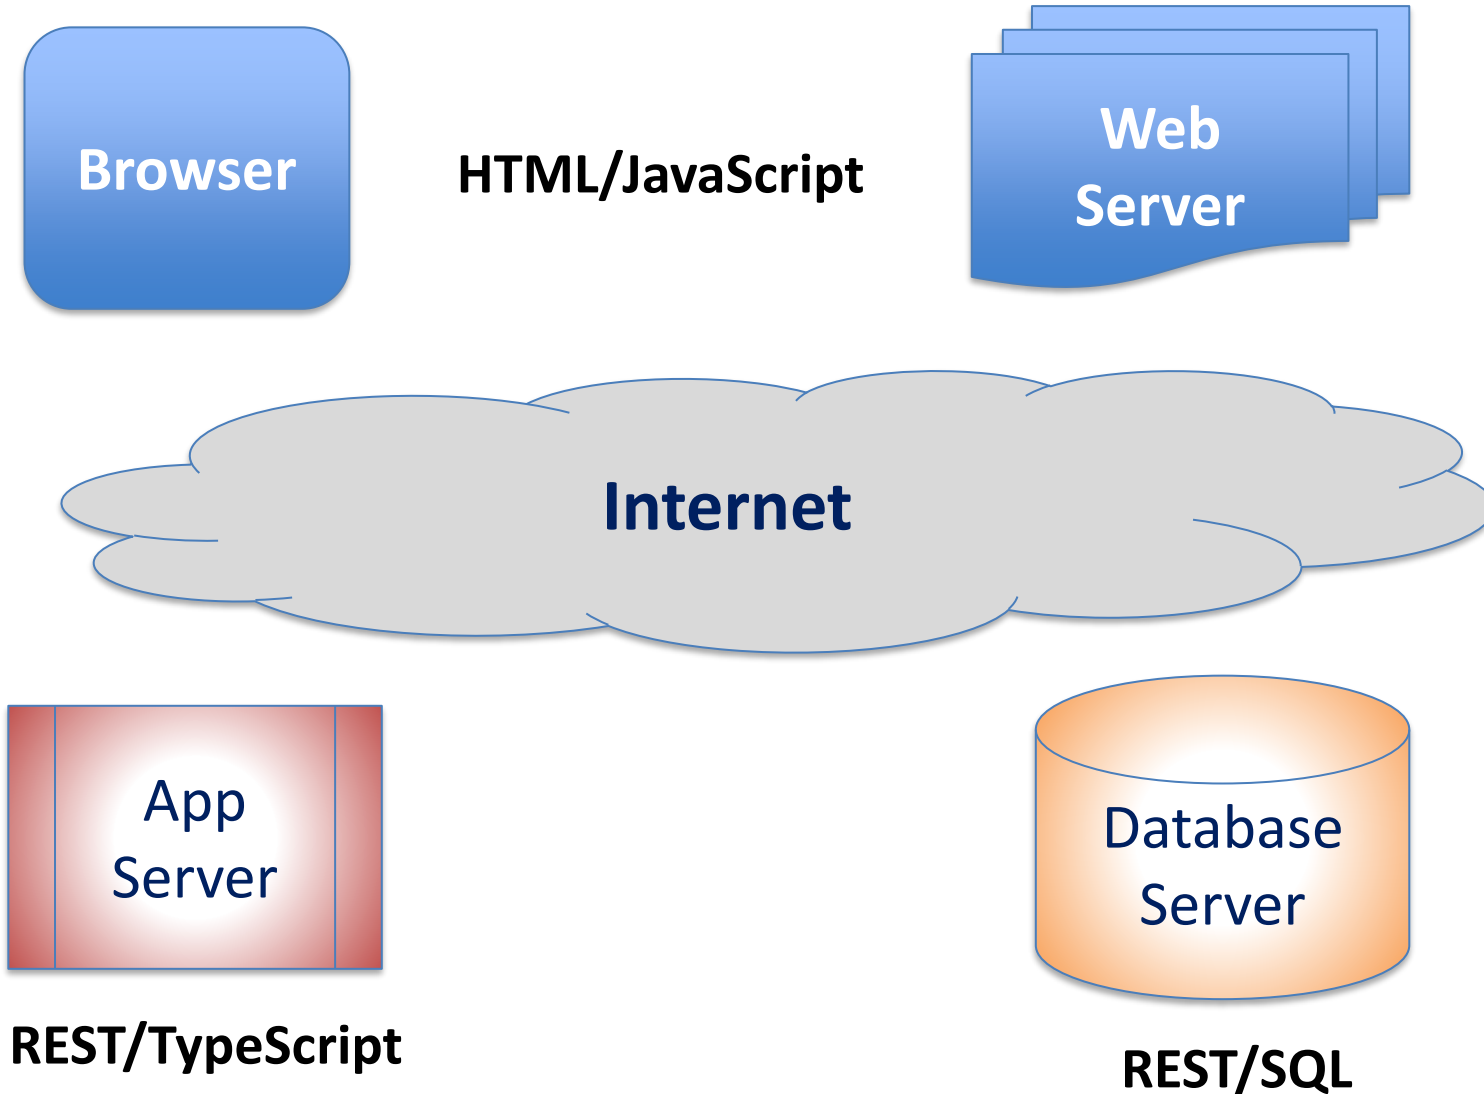

Deadlines and overlapping activities are easily visible, helping users manage workloads and avoid conflicts.

Efficient Rescheduling

Drag-and-drop rescheduling streamlines updates and adjustments, saving time and enhancing productivity for busy users.

Application Architecture

First AI Ask

- I teach coding to kids. I have a student who wants write a "to do" list helper. Thinking the first UI will be kanban style (personal kanban) board. We are using supabase for the database and have a starter schema. We want to use github pages to host the app. At some point security will be important as the student wants to be abke to assign tasks to friends. Other more admin type UI's may be needed to create categories, ad users "friends":, etc.
